

Cross-Domain Knowledge Transfer for Incremental Deep Learning in Facial Expression Recognition

Nehemia Sugianto and Dian Tjondronegoro

Department of Business Strategy and Innovation, Griffith University, Australia

- Automatic facial expression recognition enables robots to measure user's satisfaction
- This paper proposes knowledge transfer method that can supports shorter and ongoing deep learning from general to the specific domains and contexts
- Experimental results demonstrate a comparable performance to train-at-once approach, which uses a single large dataset from the target domain
